

Assistant Professor Search, Comparative Politics

Dear Members of the Search Committee,

I write to express my interest in your call for an Assistant Professor in Comparative Politics. I am an Assistant Professor of Instruction in the Department of Political Science at Northwestern University. My research centers on comparative politics and quantitative methods. My work is published or forthcoming in leading outlets, including *Political Analysis*, the *British Journal of Political Science*, *World Development*, and the *Journal of Experimental Political Science*.

My research agenda focuses on the challenges to accountability, representation, and governance in the Global South. These are areas where scholars, governments, and civil society organizations have devoted considerable resources to the implementation of pro-democracy interventions, ranging from gender quotas to anti-corruption investigations. However, the effectiveness of these interventions is stifled by unintended consequences emerging from informational imbalances across strategic actors.

For example, my latest research in this area delves into the unintended *gendered* consequences arising from increased attention to politicians' performance in office. One would expect increased access to information to enhance accountability, but equivalent performance can be interpreted differently depending on politicians' gender. In an article published at the *British Journal of Political Science*, my coauthors and I use an information experiment in Argentina to study gendered differential reactions to policy implementation. Previous work suggests that women face higher scrutiny for their performance in office. However, in the context of the implementation of a food distribution program, I find that voters are only responsive to performance information among men officeholders and tend to ignore performance information when told that an officeholder is a woman. This stems from voters' perception of men politicians as the default category, and the tendency to believe that women politicians' good performance stems from factors beyond the incumbent's control.

As another example, in a collaborative piece published in *World Development*, I discuss how the COVID-19 pandemic, through increased discontent with the performance of male-led executives and by priming a health issue commonly associated with women, lead to an increased demand for female political representation. However, as I show in a separate book chapter in *Norms, Gender and Corruption: Understanding the Nexus*, this increased demand for representation, even if met by an increased supply of women seeking elected office, does not immediately translate into descriptive representation due to a combination of social and institutional barriers that prevent women challengers from competing in equal footing.

This program is evolving in two directions. First, the attention to the study of unintended consequences has led to produce scholarship on improving research design in a way that

facilitates the detection of hard-to-observe social and political phenomena. For example, in a piece published in *Political Analysis*, I discuss how implementing alternatives to the standard experimental design, such as block randomization or repeated measures, may attenuate expected precision gains via explicit or implicit sample loss, a concern that prevents researchers from applying these techniques widely. Through three replications and six reanalyses, I show how precision gains from alternative designs can withstand significant degrees of sample loss.

As another example, in a solo-authored publication in the *Journal of Experimental Political Science*, I discuss the unforeseen costs of implementing double list experiments. This is a variant of the list experiment that promises narrower confidence intervals but comes with under-explored questionnaire design complications in the form of carryover design effects, a special kind of question order effect. I introduce statistical tests to diagnose this effect, which in turn facilitate the implementation of a more efficient technique.

Second, this program is expanding toward the study of organized crime in unexpected contexts as another hard-to-observe phenomena that challenges democratic governance. In a project recently award an *European Research Council Starting Grant*, my team seek to understand criminal governance in least-expected contexts from a comparative perspective. Focusing on the use of criminal governance tools in Argentina, Chile, Costa Rica, and Uruguay, we seek to expand the discipline's understanding of how criminal organizations shape and control life in the communities they operate.

At Northwestern, I primarily teach courses on quantitative methods. I lead the first course in the PhD methods sequence, focusing on probability and statistical inference, the required undergraduate level introduction to empirical political science, an undergraduate research seminar on evidence-informed decision-making, and a graduate elective on machine learning. I also lead the math camp for incoming political science and sociology students and run a year-long statistical computing workshop that introduces cutting-edge statistical programming practices.

Before joining Northwestern, I taught Data Analysis for Public Policy and Public Opinion, Introduction to Comparative Politics and, and Politics of Developing Democracies.

I am prepared to teach courses on research design, quantitative methods, accountability and representation, and the politics of developing democracies. You can find copies of current and future syllabi in my website.

I believe my expertise makes me an excellent fit at UNC-Charlotte. If you have any questions, you can contact me via email.

Sincerely,

Gustavo Diaz
Assistant Professor of Instruction
Northwestern University
